

IN THE SPECIFICATION:

The specification as amended below with replacement paragraphs shows added text with underlining and deleted text with ~~striketrough~~.

Please AMEND paragraph 12 beginning at page 3, with the following paragraph:

For example, this characteristic or feature point may be a reserved word and/or a syntax pattern of macro instruction in a document or data file.

Please AMEND paragraph 13 beginning at page 3, with the following paragraph:

In many cases, these reserved words and the syntax pattern depend on a version of the application program. For example, depending on the application program, one version of the application program may use different rules for instructing a computer (or other processing devices) to perform specific tasks in comparison to another version of the application program. Accordingly, most application programs define their own syntactical rules that control which words and/or instructions the computer understands. Thus, determining a version of the most suitable application program to open a document or a data file becomes clear by includes analyzing the document or data file and extracting these the reserved words and/or syntax patterns. Because the extracted reserved words and/or syntax patterns depend on a version of an application program used to create the reserved words and/or syntax patterns, the reserved words and/or syntax patterns are used as an indication of a suitable application program to read the document or data file. Based upon the result of an analysis of various versions of application programs, both a document or data file and application programs of various corresponding versions are displayed at the same time on a display apparatus.

Please AMEND paragraph 24 beginning at page 7, with the following paragraph:

When a valid version list 6a is generated, a detection result of ~~this the~~ the syntax pattern is ~~reflected indicated~~ and a final valid version list 6a is generated. When the version list 6a is generated, either an extraction result of a macro instruction reserved word or a detection result of a syntax pattern may be given a priority ~~to~~. For example, ~~in the case when~~ when the version ~~produced generated~~ based upon the extracted result of the macro instruction reserved word is

different from the version produced based upon the detection result of the syntax pattern. ~~The~~ a latest version of an application program that has having ~~the~~ a larger numeral value may be employed with a priority so as to produce the valid version list 6a.
